## **PROBLEM STATEMENT:**

Minimum boiling point separation of azeotropic mixture of tri-chloromethane/methyl alcohol

## **➤ OBJECT USED:**

1. Distillation column
2. Material Stream
3. Recycle block
4. Valve

## **INTRODUCTION:**

Methanol is a simple alcohol which is light, volatile and colorless. Trichloromethane is an organic compound

which has application. Anesthetic preserver in production of polytetraflouroethane. And reagents in several processes. The mixture of tri-chloromethane – methyl alcohol forms a minimum boiling point azeotropic with 34 mole percent methyl alcohol at 327 K under 1 atm pressure. In order to separate the mixture efficiently we use pressure swing distillation because it is more economical as compared to other processes. It is process in which distillation uses two columns operating at two different pressure to separate mixture by recycling the distillate streams.

### **PROCESS:-**

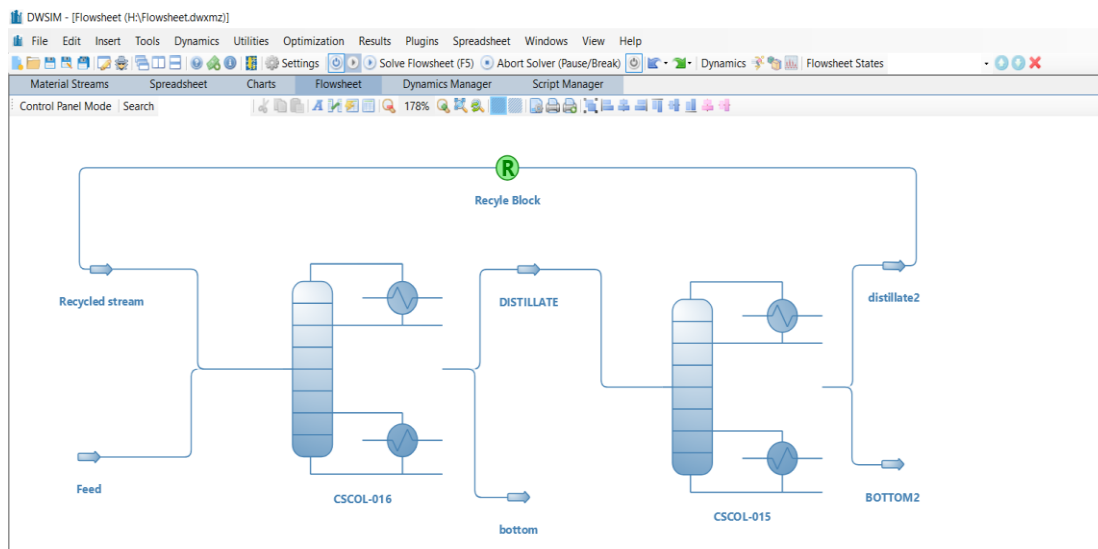

In this process stream FEED having 0.5 mol fraction of methanol and 0.5 mol fraction of chloroform in distillation column which has 24 stages. The feed is fed to 9th stage. And recycled one at 18th stage. The flow rate is 100 kmol/hr at 300 k. whereas recycle ratio is 0.64. The first distillation bottom product contains 0.995 mol % of methanol and temperature is 337.738 K. The distillate from first column is send to the second column using pump having 810600 Pascal pressure difference from distillate. The feeding stage in second

column is at 20<sup>th</sup> stage. And the number and stages and reflux ratio is 25 and 0.95. The distillate2 from second column is recycled and fed back to first distillation column of stage 3 and the bottom product contain 0.995 mol% chloroform with 49.32 kmol/hr.

Here first column is at low pressure i.e at 1 atm and second column is at 9.99 atm pressure.

## FLWSHEET:

## VALUES OF STREAMS:

	FEED	DISTILLATE	BOTTOM	BOTTOM2	DISTILLATE2	FFED2	mixstream	Recycle
Temperature (K)	300	335.461	337.738	426.498	415.941	335.681	336.262	336.262
